

Online Food Delivery System - Fully Dressed Use Cases

Use Case 1: Place a Food Order

Scope

Online Food Delivery System

Level

User-Goal

Primary Actor

Customer

Stakeholders and Interests

- Customer: Wants to browse restaurants, select food items, and place an order easily and securely.
- Restaurant: Wants to receive accurate order details and timely payment.
- Delivery Rider: Wants clear pickup and drop-off instructions.
- System Owner (Company): Wants smooth operation, secure transactions, and customer satisfaction.

Preconditions

- The customer must be logged into the system.
- Restaurants and menu items are already available in the system.

Success Guarantee (Postconditions)

- The order is successfully recorded in the system.
- The customer receives an order confirmation message and estimated delivery time.

Main Success Scenario

1. The customer logs into the online food delivery app.
2. The customer selects a nearby restaurant.
3. The system displays the restaurant's menu with prices and item details.
4. The customer selects desired food items and adds them to the cart.
5. The customer proceeds to checkout.
6. The customer provides a delivery address and payment details.
7. The system validates the payment information.
8. The system sends the order details to the restaurant.
9. The restaurant confirms order acceptance.
10. The system sends a confirmation notification to the customer with an estimated delivery time.

Extensions (Alternate Flows)

- 2a. If the restaurant is closed then The system displays 'Restaurant currently unavailable.'
- 6a. If the payment method fails then The system displays 'Payment declined. Try another method.'
- 8a. If the restaurant rejects the order then The system notifies the customer and refunds the payment.
- 9a. If no delivery rider is available then The system delays the order and notifies the customer.

Special Requirements (Non-Functional)

Required non-functional requirements

Use Case 2: Track Order Status**Scope**

Online Food Delivery System

Level

User-Goal

Primary Actor

Customer

Stakeholders and Interests

- Customer: Wants to know the real-time progress of the order to estimate delivery time.
- Delivery Rider: Wants to ensure that tracking information is accurate and updated.
- Restaurant: Wants to maintain transparency and customer satisfaction.
- System Owner (Company): Wants to ensure system reliability and customer trust through accurate tracking.

Preconditions

- The customer must have successfully placed an order.
- The order tracking feature is active for that order.

Success Guarantee (Postconditions)

- The customer successfully views the current order status and estimated delivery time.

Main Success Scenario

1. The customer logs into the food delivery application.
2. The customer navigates to 'My Orders.'
3. The system displays the list of recent orders.
4. The customer selects the active order to view details.

5. The system retrieves the current order status from the database.
6. The system displays the current status and estimated delivery time on the screen.
7. The system automatically updates the order status as it progresses.
8. The customer views the map with real-time delivery tracking.

Extensions (Alternate Flows)

- 1a. If the customer is not logged in → The system prompts 'Please log in to track your orders.'
- 5a. If the system cannot retrieve status (network issue) → The system shows 'Unable to fetch order details. Try again later.'
- 8a. If GPS tracking is temporarily unavailable → The system displays last known location and notifies the customer.

Special Requirements (Non-Functional)

- The order status should update every 10 seconds. (Performance)
- The system must ensure all tracking data is accurate and consistent. (Reliability)
- The interface should be clear and easy to understand for all users. (Usability)
- The system should work on both Android and iOS platforms. (Portability)
- The system must protect the location data of the rider and customer using encryption. (Security)
